Urucú is a plant bearing a pod, the interior of which yields a red paint used in body painting and the decoration of artifacts.

Bitter manioc was by far the most important crop, while maize and sweet potatoes ranked second and third, respectively. Most of the crops were planted in the same three-to-four-week period, but the gardener usually planted manioc before the other vegetables. For this purpose, holes were dug at six to ten foot intervals wherever space between the charred logs permitted. A short trench was first dug with a hoe, and then, from the opposite side, an adjacent trench was dug. The loose earth from the second trench was piled into the first, in which the manioc was then planted. Each pair of trenches was made with about fifty hoe strokes.

Shoots for planting were obtained by cutting sections from the stalks of old manioc plants. About ten shoots were planted in each hole by thrusting them at an angle into the loose earth. The gardener tried to plant the stems deeply so that the developing tubers would receive maximum moisture. Slipshod gardeners, however, often thrust them in lightly and heaped earth around the stems. The shoots were inserted at slightly different angles to minimize the tangle of stems and thus facilitate the harvesting, but all shoots pointed in a general westerly direction. Quain was told that if they were planted otherwise, the wind would break the growing stalks.

The procedure for planting maize was somewhat simpler. The gardener brought a large container of seed corn and a jug of water to the area to be planted. He soaked some of the kernels, and then put them in a small gourd which he carried with him. Small holes, three to four inches deep, were dug with a digging stick (*mica*) or knife blade in the open spaces between the manioc holes. Into each hole three or four kernels were dropped. A small pile of the loose earth that had just been dug up remained next to the depression in which the corn was planted. This served to trap the early rains. The digging stick and knife were the only implements used in maize planting, whereas only the hoe was used to plant manioc.

Men planted manioc; the women were said by the men to "not know how." Indicative of the importance of manioc, the word for planting refers only to manioc planting. Thus, a man who told Quain that he had finished his planting went to his garden the next day to put in sweet potatoes. Similarly, Quain was told that women do not "plant." He soon learned, however, that women could plant other crops, but, with the exception of cotton, it was always done under the supervision of the men.

The most active horticultural role of the women was harvesting. The wife of the gardener went to his plot to dig up manioc and pick vegetables, which she carried back to the village in a basketry container balanced on her head. If the gardener had no wife, the female relative in his household who prepared his food brought in his crop.
